

WebAccess™ Module Store and Forward Telemedicine Software

PROFESSIONAL

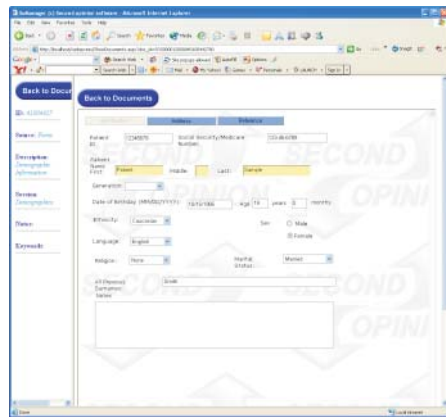

WebAccess™ is a web portal application that links to your existing **Second Opinion™** Professional system. With proper credentials you can see and interact with all of the patients and documents contained in the system via the web. Patient folders can be created, forms filled out, and documents uploaded, all via the web. Links to existing patient folders can be created and sent via email to an expert. Remote users can access the system and use their existing user account or they can use a computer generated time limited username and password. This enables secure web access to patient information without having to send it to other locations.

Forms created using our Custom Form Designer are accessible not only using **Second Opinion™** Professional but also through the web. To display large images, **WebAccess™** uses byte streaming technology with varying image size and quality to maximize the efficiency of the access bandwidth.
